

CLOSE-UP

First, thanks a lot for purchasing this project. If you encounter a problem with it, drop me a message from my VideoHive Profile Page here (contact form at the right bottom):

<http://videohive.net/user/signs09?ref=signs09>

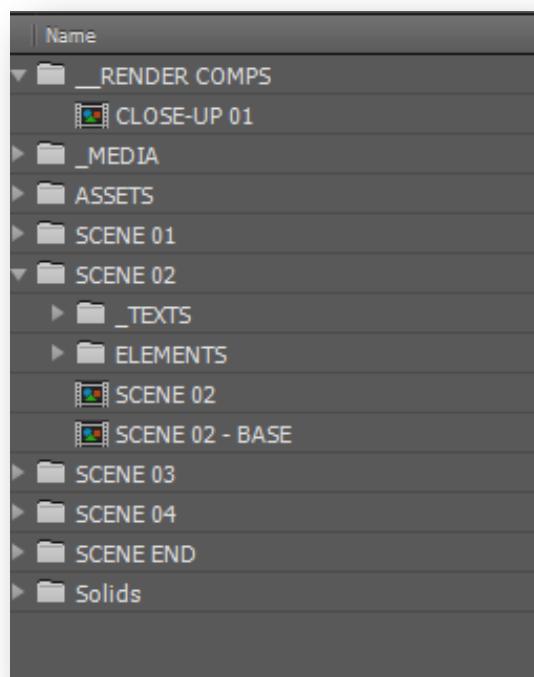

Please, **dont forget to rate this project** on your download page on VideoHive.

My portfolio stay here, please take a look at the different previous porjects:

<http://videohive.net/user/signs09/portfolio?ref=signs09>

1. PROJECT'S STRUCTURE

Here is a screenshot of the inside AE project's structure with the main folders and subfolders in the AE Project's panel.

The **MEDIA** folder includes ALL the MEDIA PLACEHOLDERS. The **MEDIA Comps** subfolder contains a tallying composition (for each media); this composition allows to adjust easily scale or position properties of the media layer.

The ready-to-render composition is located in the **RENDER COMPS** folder.

The **ASSETS** folder includes the different compositions or prerendered sequences used in the whole project.

This project is subdivided into several **SCENES**. Each of them has its own folder. A Scene folder includes a **TEXTS** subfolder (with all **TEXTS** placeholders for the concerned scene), an **ELEMENTS** subfolder (grouping together the different comps. used specifically in the

concerned scene. Each Scene folder includes also one or two base Scene main compositions where settings can be edited easily for the most components of the concerned scene.

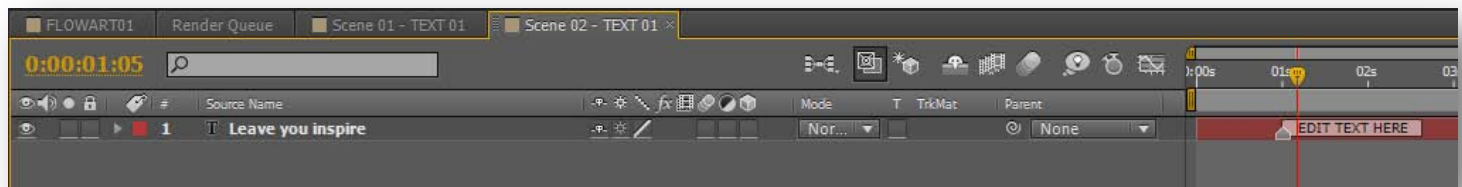

2. TEXTS EDITION

Texts placeholders are grouped together scene by scene. All the texts placeholders tallying to a scene are located into a TEXTS subfolder of this scene.

Normally, simply open each of these texts compositions and edit each of the included texts layers with the TYPE tool.

Be attentive to the various timelines markers notes. Most often they mention the best location to edit the concerned text layer.

3. MEDIA REPLACEMENT

All the **MEDIA** placeholders are located in the MEDIA folder. I used initially files with 1280 pixels width and 720 pixels height.

Simply select a media placeholder and use MENU FILE / REPLACE FOOTAGE / FILE or the CTRL H keyboard shortcut. You can also make a right click to select the media holder and choose the command Replace Footage / File in the appearing contextual menu (see next illustration).

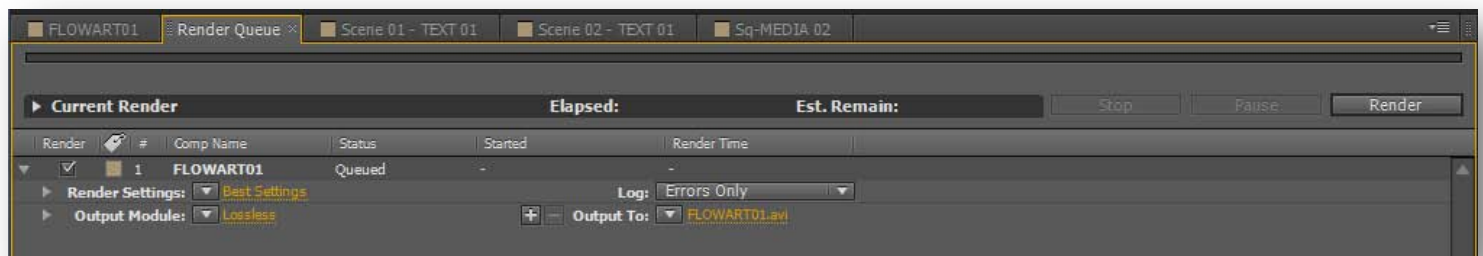

Please don't forget to check the tallying composition in the **MEDIA Comps subfolder** after each media replacement; especially if you use media with different dimensions.

CLOSE-UP

4. RENDER PROCESS

Once you edited the text placeholders and replaced media placeholders, don't forget to check the render comp. (you can make a RAM preview): texts and media have to fit within the project.

To launch the render process, open the render comp and use Menu Composition / Add To Render Queue. The "Render Queue" Panel (below picture) will open with your render task.

I hope this helpfile was helpful for you. If you encounter problems drop me a message from my VideoHive Profile Page (contact form bottom right of this page):
